

2. First Letters

I need a program (written in `FirstLetters/main.cpp`) that can read from standard input and print only the first letter of each word. For this problem a word is defined as an sequence of consecutive alphabetic (A-Za-z) character(s) separated by non-alphabetic characters(s).

Example Input:

```
This is a Sentence with "first-letters" of various types!  
Even words with numb3rs in them count  
and lines that start with whiteSpace.
```

Expected output:

```
TiaSwflovteWwnritcaltsww
```
