

## 2. Remove The Algorithms

In the folder "RemoveTheAlgorithms" is an implementation and header file. The function defined in that folder makes heavy use of algorithms to do some convoluted task. You need to remove the uses of the algorithms (like `transform`) and replace them with loops and other statements so that the same functionality is maintained. A copy of the starter code is saved in "RemoveTheAlgorithms/func.cpp.bak" in case you break functionality when you are working on it.
