RemoveShortWords

I've been given a list of search terms (multiple lines, separated by spaces) that I need to comb through. All words of length 4 and shorter need to be removed.

Write a program that reads from standard input a series of search terms. This program should be in the file `RemoveShortWords/main.cpp`. Write to standard output only the words that are length 5 or greater, in the order of the original input separated by a single space character.

Example input:

```
this line only has one long word here! no othe r
however this_line contains entirely extremely lengthy words
this line contains both short and long words
```

Expected output:

```
here! however this_line contains entirely extremely lengthy words contains short wo
```
